### (5) CAPACITANCE VALUE

2 significant digits+number of zeros

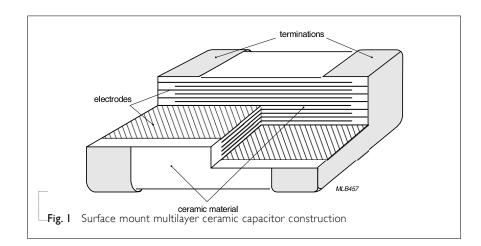

The 3rd digit signifies the multiplying factor, and letter R is decimal point

Example:  $103 = 10 \times 10^3 = 10,000 \text{ pF} = 10 \text{ nF}$ 

### CONSTRUCTION

The capacitor consists of a rectangular block of ceramic dielectric in which a number of interleaved metal electrodes are contained. This structure gives rise to a high capacitance per unit volume.

The inner electrodes are connected to the two end terminations and finally covered with a layer of plated tin (NiSn). The terminations are lead-free. A cross section of the structure is shown in Fig. I.

### **ELECTRICAL CHARACTERISTICS**

### **X5R DIELECTRIC CAPACITORS; NISN TERMINATIONS**

Unless otherwise specified, all tests and measurements shall be made under standard atmospheric conditions for testing as given in 5.3 of IEC 60068-1:

- Temperature: 15 °C to 35 °C - Relative humidity: 25% to 75% - Air pressure: 86 kPa to 106 kPa

Table 6

Before the measurements are made, the capacitor shall be stored at the measuring temperature for a time sufficient to allow the entire capacitor to reach this temperature.

The period as prescribed for recovery at the end of a test is normally sufficient for this purpose.
